

ROKSNET

BLOCKCHAIN MESSENGER

Standard in countries:

Estonia and Finland

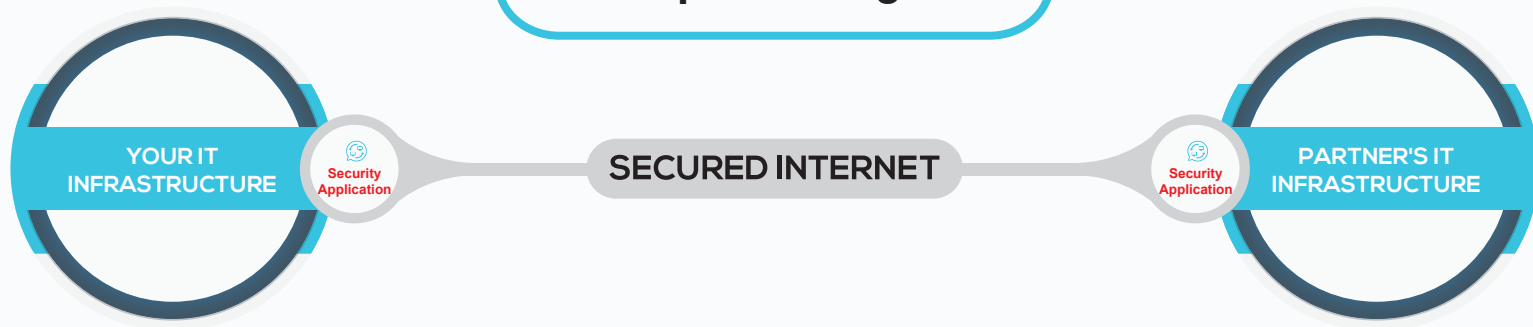

Ready-to-use solution for secure integration between **information systems, both domestically and across borders.**

Cooperation between Estonia's ***X-Road*** and Finland's ***Palveluväylä*** projects has resulted in the development of a unique technology for distributed and secure data exchange, which is already used by more than 1,300 information systems.

ROKSNET ALLOWS for this technology to **be easily and quickly (within hours)** implemented in any EU state agencies or private enterprises.

In today's society, one of the biggest challenges, and opportunities, is digital cooperation between public authorities and private enterprises, including the exchange of personal data. The digital exchange of data helps optimise and automate inter-organisational (business) processes, thereby reducing bureaucracy and promoting economic growth.

A simplified diagram:

The result is a data exchange, signed, stored and time-stamped through RoksNet Data Messenger, between two or more information systems, which complies with the requirements of eIDAS Regulation (EU) No. 910/2014 and allows organisations to better meet the provisions of the General Data Protection Regulation (EU) 2016/679 (GDPR).

A Ready Component for several EU e-society applications, such as:
